CPE/CSC 365Introduction to Database Systems

Alexander Dekhtyar Eriq Augustine

SQL Data Definition and Data Manipulation Languages (DDL and DML)

Data Definition Language.

Creating a Relation

CREATE TABLE Name (
attribute-declarations
constraint-declarations

Attribute declarations:

AttName AttType [default expression] [ColConstraints]

Constraints

Column constraints:

[constraint <ConstName>] [NOT] NULL: Not null constraint.

[constraint <ConstName>] PRIMARY KEY: Primary key constraint (when the primary key consists of exactly one attribute, otherwise, use constraint declaration).

[constraint <ConstName>] UNIQUE: Key constraint (when the key consists of exactly one attribute, otherwise, use constraint declaration).

[constraint <ConstName>] REFERENCES <Table>(<AttName>) [ON DELETE CASCADE]: Foreign key constraint (when the foreign key consists of exactly one attribute, otherwise, use constraint declaration). ON DELETE CASCADE specifies that all rows containing a no longer existing value for must be deleted.

[constraint <ConstName>] CHECK (<condition>): any additional constraint on the value of the element in the table¹.

Constraint declarations:

[constraint <ConstName>] PRIMARY KEY (<AttNames>): Primary key constraint. Use when the primary key includes multiple attributes.

[constraint <ConstName>] UNIQUE (<AttNames>): Key constraint. Use when the key includes multiple attributes.

¹ Many MySQL implementations/engines will ignore the CHECK constraint. Make sure to check if your specific configuration acknowledges it.

[constraint <ConstName>] FOREIGN KEY (<AttNames>) REFERENCES <Table> (<AttNames>): Foreign key constraint. Use when the foreign key involve multiple attributes.

All column constraints except for not null constraint can only be used if the appropriate constraint (e.g., primary key) is associated with exactly one attribute. (i.e., if your primary key is two attributes, use the constraint declaration, rather than column constraint).

Types

Integer	INTEGER or INT
	SHORTINT
Real	FLOAT or REAL
	DOUBLE PRECISION
Fixed Point	$\mathtt{DECIMAL}(n,d)$
	n - number of digits
	d - number of decimals
	$\mathtt{NUMBER}(n,d) \; (\mathrm{Oracle})$
Strings	$\mathtt{CHAR}(\mathrm{n})$
	n - length of string, max=255
	VARCHAR(n),
	VARCHAR2(n) (Oracle)
	n - length of string, max = 2000
Bit Strings	$\mathtt{BIT}(\mathtt{n})$
	t BIT VARYING(n)
Boolean	BOOLEAN
	values: TRUE, FALSE, UNKNOWN
Dates	DATE
	formatted as a string, converted to INT internally
	default format: 'DD-MON-YEAR'. e.g., '12-APR-2007'
Blob	BLOB
	TEXT

Full Reference

The complete definition for CREATE TABLE is actually quite long. For a full reference on MySQL's CREATE TBALE command, see: http://dev.mysql.com/doc/refman/5.1/en/create-table.html

Examples

```
CREATE TABLE Books (
   libCode INT,
   isbn CHAR(20),
   title CHAR(80),
   authors CHAR(60),
   year INT,
   publisher CHAR(20),
   purchPrice REAL,
   takeHome BOOLEAN,
   PRIMARY KEY(libCode),
   UNIQUE(isbn)
);
CREATE TABLE Employees (
   ssn INT PRIMARY KEY CHECK (ssn > 0),
   name \mathbf{CHAR}(30) NOT NULL,
   department INT REFERENCES Departments,
   salary FLOAT NOT NULL CHECK (salary >= 20000.00),
   position CHAR(30) DEFAULT 'Not_Specified',
   startYear INT CHECK(startYear > 1992)
);
CREATE TABLE Departments (
   deptID INT PRIMARY KEY,
   name CHAR(30) UNIQUE,
   head INT CHECK (head > 0),
   FOREIGN KEY(head) REFERENCES Employees(ssn)
   );
```

Deleting a Table

DROP TABLE Name [CASCADE] Example:

DROP TABLE Books;

Be aware, that referential integrity constraints (foreign keys) may prevent a table from being dropped in the incorrect order. If you have circular constraints (it is possible), then you will have to modify one of the tables to first remove the constraint before dropping the table.

Modifying a Table

Adding an attribute
 ALTER TABLE Name
 ADD ([AttName Type]+)
 Example:

ALTER TABLE Books ADD (genre CHAR(10), numPages INT);

• Deleting an attribute

ALTER TABLE Name DROP (AttName+) Example:

ALTER TABLE Books DROP (year);

• Modifying an attribute

```
ALTER TABLE Name MODIFY ( [AttName\ Type]+ )
```

Example:

```
ALTER TABLE Books
MODIFY (genre VARCHAR(30));
```

There are **MANY** different ways that you can modify a table. See the complete MySQL reference for more details: http://dev.mysql.com/doc/refman/5.1/en/alter-table.html

Data Manipulation Language

Inserting a Tuple

INSERT INTO TableName(AttNames)
VALUES(values)

values — comma-separated list of values. The number of values must match the number attribute names in AttNames, and the types must be compatible.

INSERT INTO TableName

VALUES (values)

Values for all attributes must be given and in the order in which attributes were defined in CREATE TABLE command.

Examples:

Note that a single quote (') is escaped by using a second single quote as in the above example.

Deleting Tuples

```
DELETE FROM TableName
```

WHERE Expression

Expression identifies the properties of tuples to be removed from the table.

Examples:

```
DELETE FROM Books
WHERE year < 1950
```

DELETE FROM Books

WHERE libCode = 12349;

DELETE FROM Books

WHERE purchPrice > 100.00 AND year < 1950;

Updating Tuples

UPDATE TableName

 ${\tt SET}$ Assignments

WHERE Expression

Expression identifies tuples to be updated. Assignments specifies modifications.

Examples:

```
UPDATE Books
SET year = 2003
WHERE year > 2003;
```

UPDATE Books

SET year = year - 1, purchPrice = purchPrice * 1.05; WHERE year > 2000;

UPDATE Books

SET takeHome = **TRUE**;
